

ABSTRACT OF THE DISCLOSURE

The present invention provides an audio data recording medium reproducer, wherein CPU 10 which writes audio data read by reader 11 into buffer memory 13 and buffer memory controller 21 which transfers the data to buffer memory 22 and inputs it into DAC 23 at a predetermined data rate are connected by a bus, and furthermore, CPU 20 for controlling a user interface is separately provided. Provision of a plurality of such simple controllers reduces costs to be lower than in the case of providing one high-performance controller. Furthermore, it also becomes possible to separately construct the respective functional parts as units.
